An intake agent that works inside the CRM.

Aislyn Gilmore | Voice intake & CRM orchestration

Built for an architectural company, this n8n workflow connects live voice intake to Pipedrive organization and contact lookups, conditional record creation, opportunity routing and specialist follow-up. A separate post-call monitor checks whether the required intake tool was observed without an explicit failure.

ORIGINAL n8n WORKFLOW VIEW / Model label anonymized

Four scenarios. One consistent handoff.

COMPANY	CALLER	CRM ACTION
New	New	Create organization, create linked contact, then create deal.
Existing	Existing	Reuse matched records and create a new deal.
New	Existing	Create organization; use it and the existing caller in the deal.
Existing	New	Create a contact under the existing organization, then create deal.

“Existing” means a record satisfies the workflow’s matching rules. Organization matching uses an exact normalized name and at least 90% address similarity; person validators compare name, phone, email and role.

Customer + specialist + HQ. The selected branch sends a formatted HTML confirmation to the customer, copies the product specialist and BCCs headquarters. Missing or explicitly failed intake-tool activity triggers a separate office alert for manual follow-up.

Live lookup to CRM routing

Nodes 01-08 support live calls. Nodes 09-22 prepare the submitted inquiry and resolve the organization.

#	n8n NODE / COMPONENT	FUNCTION
01	**Webhook1**	Receives a live organization-lookup request from the voice agent.
02	**Search an organization**	Searches Pipedrive for an exact organization-name match.
03	**Code in JavaScript**	Formats the organization result into a found flag, ID and available company details.
04	**Respond to Webhook1**	Returns the organization-lookup result to the voice agent during the call.
05	**Webhook2**	Receives a live caller-profile lookup request.
06	**Search a person**	Searches Pipedrive contacts using the caller’s name.
07	**Code in JavaScript1**	Normalizes name matching and extracts the contact ID, email, phone and available role.
08	**Respond to Webhook2**	Returns the caller-profile result to the voice agent.
09	**Webhook**	Accepts the completed intake submission that initiates CRM processing.
10	**Respond to Webhook**	Acknowledges receipt of the intake request to the calling system.
11	**Code1**	Normalizes incoming field names and customer/project data into a consistent structure.
12	**Create or update a record1**	Writes the submitted contact and project details to Airtable using an upsert operation.
13	**If1**	Checks for the sender-email field before continuing into confirmation processing.
14	**AI Agent**	Drafts an HTML confirmation summarizing the supplied customer and project information.
15	**Confirmation Model**	Supplies the language-model capability for the AI Agent’s confirmation draft.
16	**Message a model1**	Extracts the bid date or deadline and converts it into a structured calendar date.
17	**Merge2**	Combines the confirmation output with the extracted bid-date data.
18	**Pipeline Classifier2**	Normalizes product-line text, applies aliases/fuzzy matching and selects a CRM stage and specialist.
19	**Search an organization1**	Checks Pipedrive again for the organization named in the completed intake.
20	**Organization Filter**	Compares normalized company names and address similarity to decide whether to reuse a record.
21	**If3**	Branches into new-organization or existing-organization processing.
22	**Create an organization**	Creates the missing organization with address, company type and phone details.

Event-driven design. The intake-submission webhook starts CRM processing when the agent submits the collected information. The independent post-call webhook handles completion monitoring.

Record creation & completion checks

Nodes 23-38 cover the four CRM paths. Nodes 39-45 monitor intake-tool activity and handle call recordings.

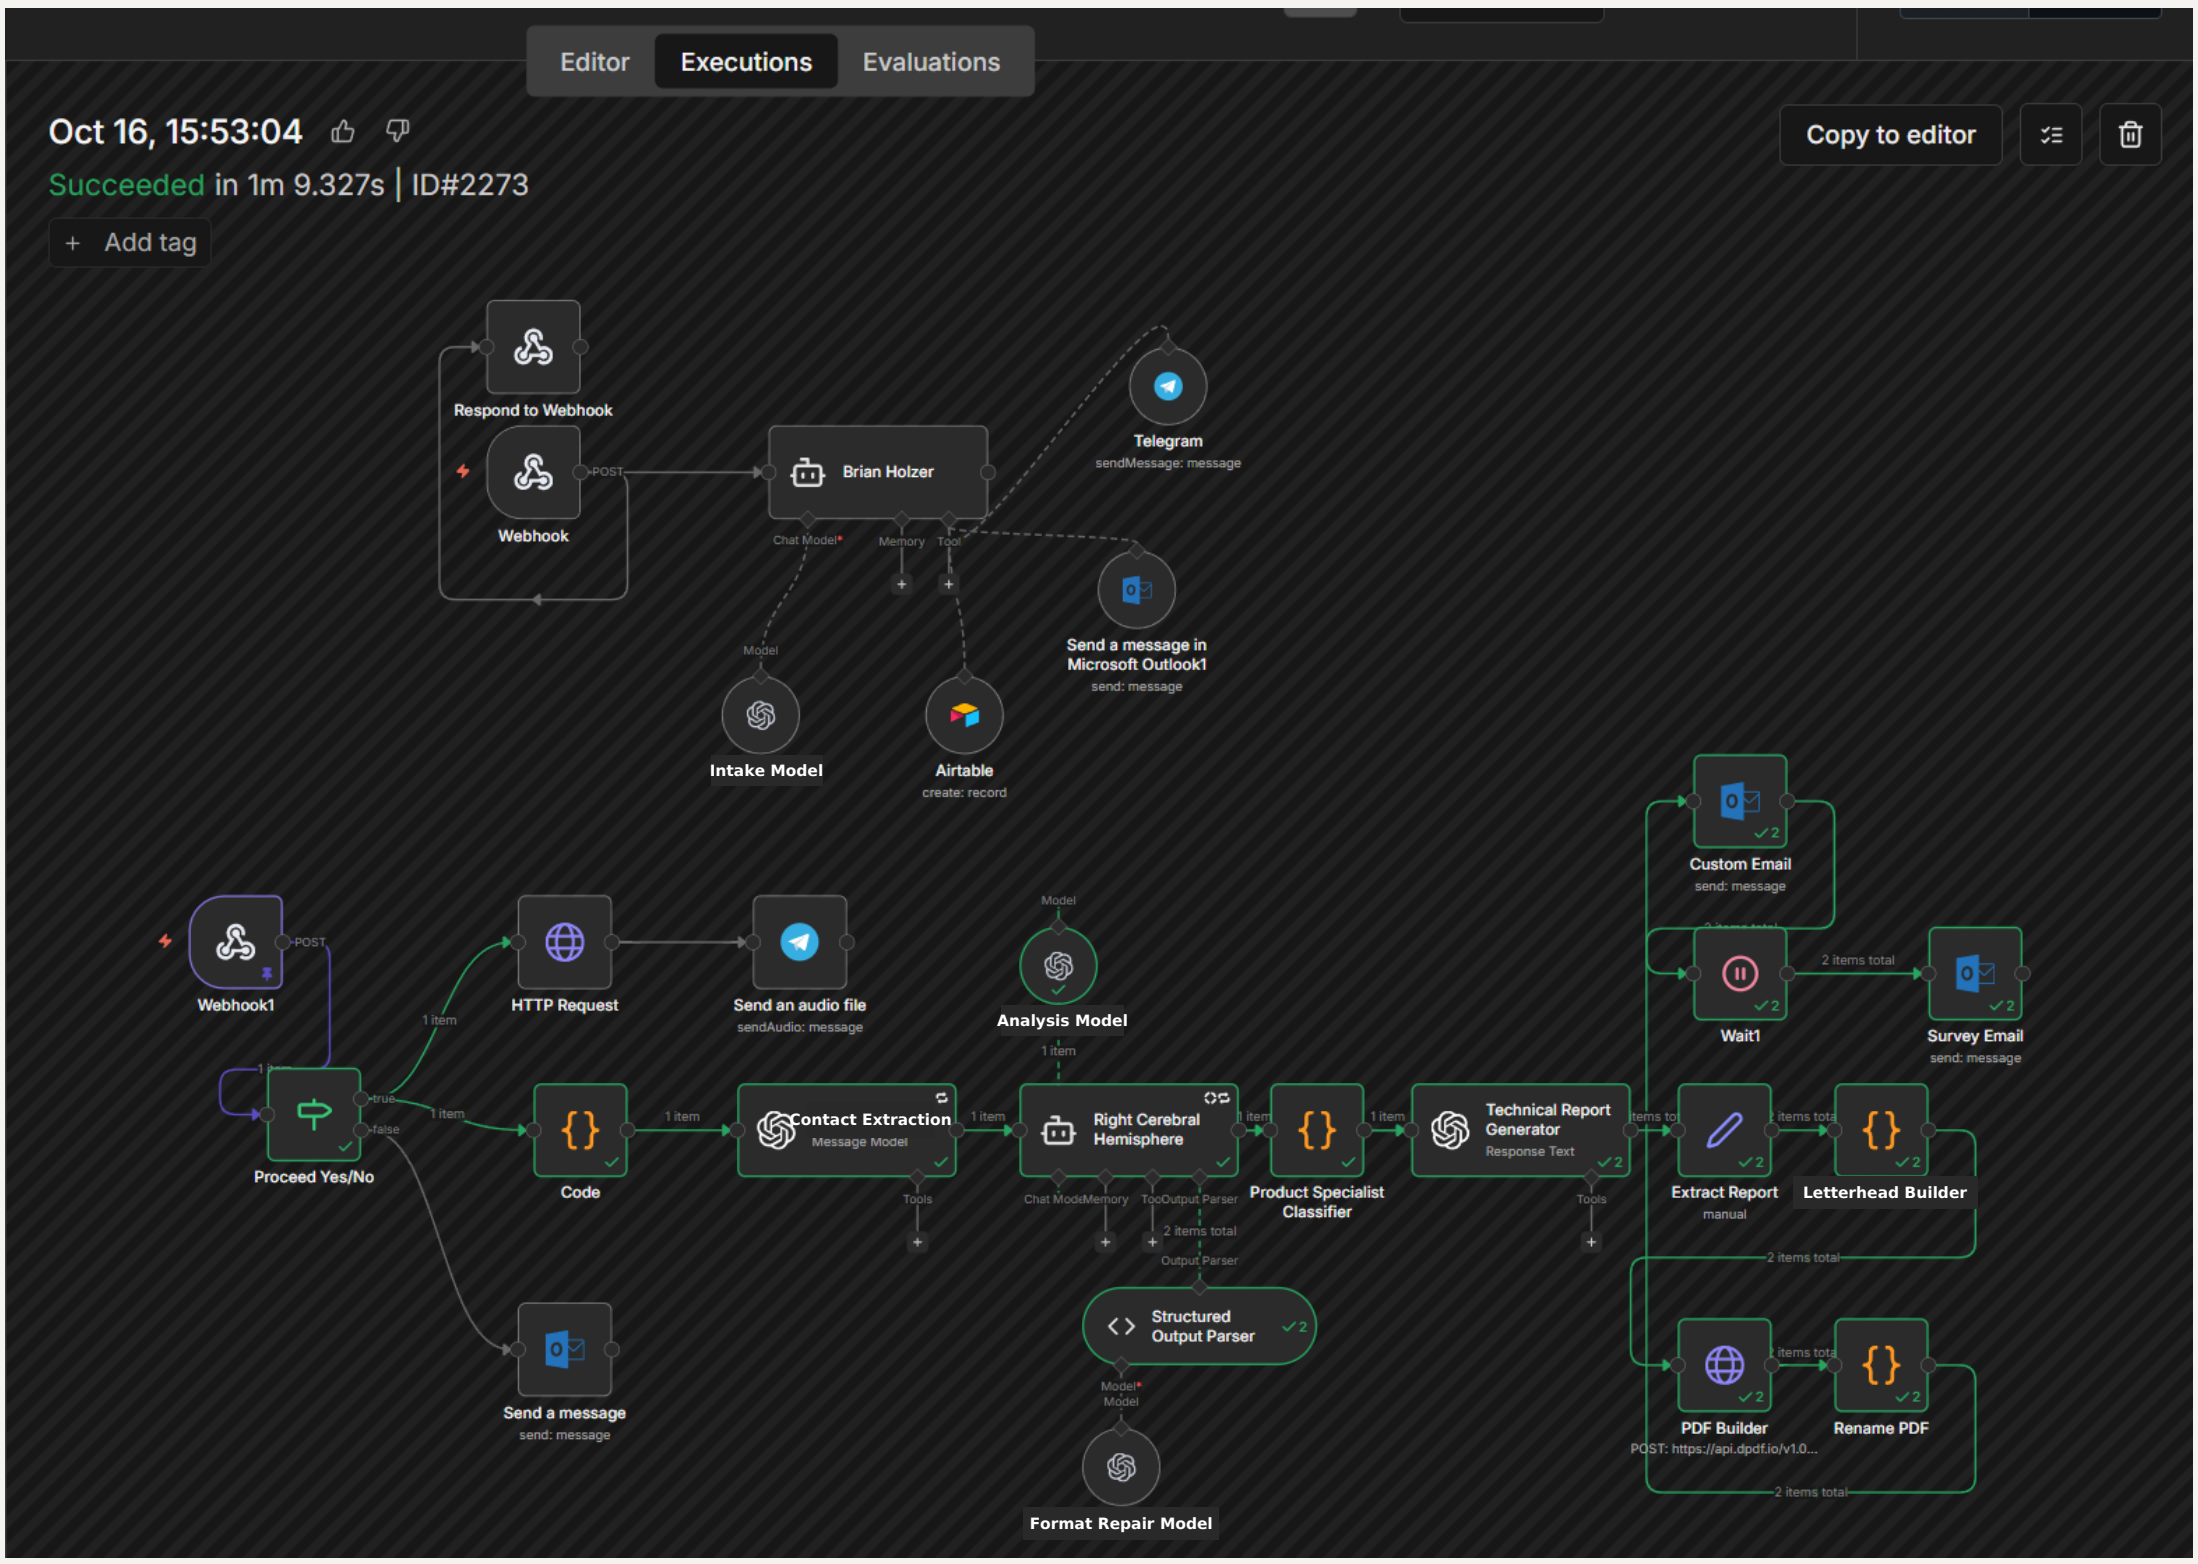

#	n8n NODE / COMPONENT	FUNCTION
23	**Search a person2**	Searches for the caller after a new organization has been created.
24	**Person Validator1**	Applies normalized name, phone, email and role comparisons on the new-organization branch.
25	**If4**	Selects a new-contact or existing-contact path for the newly created organization.
26	**Create a person**	Creates a new caller profile associated with the new organization.
27	**Create a deal1**	Creates the opportunity for a new organization and new caller, with project fields and stage.
28	**Send a message**	Sends this branch’s HTML confirmation to the customer, copying the specialist and BCCing HQ.
29	**Create a deal4**	Creates the opportunity using the new organization and the existing caller record.
30	**Send a message1**	Sends the new-organization/existing-caller branch’s customer and specialist confirmation.
31	**Search a person1**	Searches for the caller when the organization is already matched in Pipedrive.
32	**Person Validator**	Applies normalized name, phone, email and role comparisons on the existing-organization branch.
33	**If5**	Selects a new-contact or existing-contact path for the matched organization.
34	**Create a person1**	Creates a new caller profile linked to the existing organization.
35	**Create a deal**	Creates the opportunity for the existing organization and newly created caller.
36	**Send a message3**	Sends the existing-organization/new-caller branch’s customer and specialist confirmation.
37	**Create a deal3**	Creates the opportunity using the existing organization and existing caller records.
38	**Send a message2**	Sends the existing-organization/existing-caller branch’s customer and specialist confirmation.
39	**Aislyn PostCall**	Receives the post-call event used for completion monitoring and recording handling.
40	**If2**	Routes transcription events to the completion check; other events go to the audio-request branch.
41	**Check Aislyn Completion**	Inspects transcript tool calls and results; flags the required intake tool if absent or explicitly failed.
42	**If**	Routes flagged conversations to the incomplete-call alert.
43	**Send a message4**	Sends the office an incomplete-call alert with the conversation summary and follow-up context.
44	**HTTP Request**	Retrieves the call recording from the voice platform using the conversation ID.
45	**Send an audio file**	Forwards the retrieved call recording to the configured Telegram chat.

Completion signal. The monitor evaluates tool-call evidence and explicit failure flags, then packages the conversation context for office follow-up when needed.

From conversation to technical follow-up.

Brian Holzer | AI technical-support agent

An architectural company uses Brian to capture inquiries, notify its team and turn completed calls into personalized customer follow-up. n8n is the workflow automation platform coordinating the APIs, AI processing, records and communications.

ORIGINAL n8n EXECUTION VIEW

Client and model labels anonymized. Workflow connections and execution indicators retained.

01 During the call

Submitted details create an Airtable record and trigger internal Telegram and email alerts.

02 After the call

Transcript analysis drives specialist routing, a technical PDF and a personalized customer email.

03 Team handoff

The specialist is copied, internal recipients receive visibility and a separate branch delivers call audio.

How the workflow works

The upper workflow handles intake during the call. The lower workflow processes the completed conversation. Model and tool nodes support the steps they are connected to.

#	STEP / COMPONENT	FUNCTION
01	**Webhook**	Receives submitted caller details and the inquiry through a POST request.
02	**Respond to Webhook**	Returns an acknowledgement to the system submitting the request.
03	**Brian Holzer**	Coordinates intake processing and invokes the connected record and notification tools.
04	**Intake Model**	Provides the language-model capability used by the intake coordinator.
05	**Airtable**	Creates a record with the caller’s name, company, email, phone and inquiry.
06	**Telegram**	Sends the business an internal alert containing the new inquiry and contact details.
07	**Outlook notification tool**	Emails internal recipients with the submitted inquiry and caller information.
08	**Webhook1**	Receives the post-call transcript, conversation ID, collected fields and metadata.
09	**Proceed Yes/No**	Routes calls with a captured email to follow-up; otherwise triggers an internal alert.
10	**Send a message**	Sends a manual-follow-up alert with call details, termination reason and summary.
11	**HTTP Request**	Requests the conversation recording from the voice platform’s API as an audio file.
12	**Send an audio file**	Delivers the retrieved recording to the configured internal Telegram chat.
13	**Code**	Combines transcript messages into a single text input for downstream analysis.
14	**Contact Extraction**	Extracts the caller’s name, company, email and phone from the transcript into JSON.
15	**Right Cerebral Hemisphere**	Drafts the personalized email, selects a product category and summarizes the inquiry.
16	**Analysis Model**	Provides the language-model capability for email drafting and conversation analysis.
17	**Structured Output Parser**	Applies a schema to the generated email and classification for downstream processing.
18	**Format Repair Model**	Supports automatic correction when generated output needs to match the parser’s schema.
19	**Product Specialist Classifier**	Maps the selected product category to a specialist’s name and email using JavaScript.
20	**Technical Report Generator**	Drafts the overview, requirements, proposed system, technical considerations and next steps.
21	**Extract Report**	Extracts the generated HTML report into a dedicated field for document assembly.
22	**Letterhead Builder**	Wraps the report in branded HTML with contact information, date and technical resources.
23	**PDF Builder**	Submits the completed HTML to a document API and receives a PDF file.
24	**Rename PDF**	Sets the attachment filename using an available company value or fallback, plus the date.
25	**Custom Email**	Sends the customer a personalized email and PDF; copies the specialist and BCCs the business.
26	**Wait1**	Pauses the workflow before the separate customer-feedback email.
27	**Survey Email**	Sends a satisfaction-survey invitation with a survey link and QR code.

Technical walkthrough available. Additional workflow examples, configuration files and implementation code can be shared for a deeper discussion.

Beyond these case studies.

Custom AI workflows, built around how a business operates.

These case studies represent a selection of my work. I build custom AI workflows around how a business operates - from the first customer interaction to the records, documents and actions that follow.

ADDITIONAL IMPLEMENTATION CAPABILITIES

01 **CRM & sales automation**

Lead qualification, contact matching, opportunity routing and follow-up.

02 **Voice & communication systems**

Conversational intake, call transfers, personalized emails and internal notifications.

03 **Document workflows**

Structured data extraction, report generation and document preparation.

04 **Custom integrations**

APIs, webhooks, databases and JavaScript or Python components.

05 **Operational monitoring**

Completion checks, exception alerts and human follow-up.

Let’s walk through the implementation.

Additional workflow examples, configuration files and implementation details are available for a technical walkthrough.
